

Central filling

with modified interval rotation

Short description

This additional option ensures fast central filling of the press with minimal rotation to ensure gentle grape processing.

Features and benefits

The "interval rotation" program mode offers the following options for the gentlest possible grape processing using central filling:

- the individually adjustable rocking movement saves complete rotations during filling
- the number and angle (up to 90 degrees) of the rocking movement are freely adjustable
- during rocking, the juice drain valve remains open in a defined area so that the juice can flow
- continuously into the juice tray.

Your advantages of central filling with modified interval rotation:

- reduction of mechanical stress on the grapes
- increased free juice flow in the same time due to a lower number of complete rotations.
