Pressing Technology

Filling with inflated membrane

Short description

This special program allows extremely gentle handling of the grapes during filling of the press via the cover opening.

Features and benefits

The membrane is pressurised with compressed air until it contacts the FLEXIDRAIN® juice channels. This creates a cushion-like pad which gently catches the grapes during filling and thus minimises mechanical stresses on the material to be pressed. The air behind the membrane escapes according to the amount of grapes filled in, so the grapes never “fall into the void” and you can still use the full capacity of your press.

Stand 09/2021; Version 1.0
