Pressing Technology

manual control unit for the juice drain valve

Short description

This additional option allows gradual opening of the juice drain valve. The valve can be opened in several steps to better control the free flow of juice.

Features and benefits

The addition of a manual control unit means you can create a continuous flow which does not overload the must pump, even for very large quantities of juice. The juice valve is opened gradually by pressing a button. This allows you to control the desired amount of must drained. This prevents the must from sputtering.
